SOME ADVANTAGES OF FLEXI-FORCE EQUIPMENT

**working in
confined
spaces**

**one
man
operation**

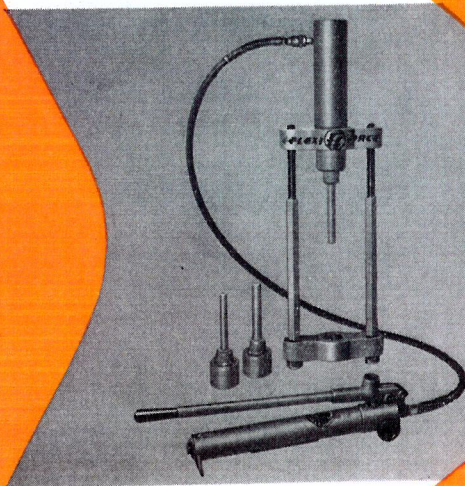

Flexi-Force equipment is extremely compact, and if required can often operate in confined spaces which would normally be regarded as inaccessible. It is particularly useful for maintenance and repair work, often eliminating the need for expensive, time consuming, dismantling operations.

The operator supplies the skill—Flexi-Force supplies the power. Having positioned the equipment on to the work, it can then be remote control operated by one man with safety.

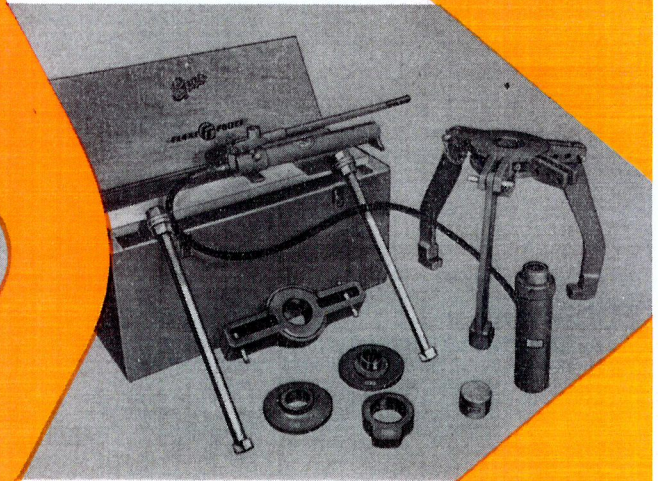

SOME ADVANTAGES OF FLEXI-FORCE EQUIPMENT

**self
contained
units**

Flexi-Force equipment does not have to depend on any outside power source—although motorised pumps are available if required for repetitive work. It is relatively portable and invariably can be taken to the job.

**you can add
to your basic
equipment**

You can buy Flexi-Force in complete outfits or in separate components according to your current requirements adding at any time to the versatility of your equipment. Since all adaptor threads are based on British Standard Pipe dimensions, there is no difficulty in making adaptors for special needs.
